Consumer Confidence Report MOUNTAIN LAKES DISTRICT 2012

2012

What is a Consumer Confidence Report?

The Consumer Confidence Report (CCR) details the quality of your drinking water, where it comes from, and where you can get more information. This annual report documents all detected primary and secondary drinking water parameters, and compares them to their respective standards known as Maximum Contaminant Levels (MCLs).

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include:

Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.

Inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming.

Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.

Organic chemical contaminants, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, can also come from gas stations, urban storm water runoff, and septic systems.

Radioactive contaminants, which can be naturallyoccurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink,

EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. The US Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

What is the source of my drinking water?

Our water comes from 3 different sources.

- 1) Gravel Infiltration Well in the pump house.
- 2) Bedrock Well 100 yards north of the pump house.
- 3) Woodsville Water and Light

Our water sources and system were able to meet our demands and <u>NO BULK WATER WAS BROUGHT</u> <u>IN.</u>

For a disinfectant we treat our sources with Sodium Hypochlorite (Liquid Chlorine).

Why are contaminants in my water? Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Do I need to take special precautions? Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS

or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

Source Water Assessment Summary

The results of the assessment, prepared on *8-1-2000* are noted below.

001 INF WELL SOURCE TAP. 2 susceptibility factors were rated high. 1 was rated medium and 9 were rated low.

004 BRW 4 SOURCE TAP. 2 susceptibility factors were rated high, 1 was rated medium and 9 were rated low.

Note: This information is over 10 years old and includes information that was current at the time the report was completed. Therefore, some of the ratings might be different if updated to reflect current information. At the present time, DES has no plans to update this data.

The Mountain Lakes District Water Dept. did two separate Microscopic Particulate Analysis (MPA) on the INF WELL SOURCE #001. The test were completed in 12-2010 through 4-2011 No issues found in either test.

The complete Assessment Report is available for review at **The Mountain Lakes District.** For more information, call **603 787 6180** or visit the DES Drinking Water Source Assessment website at http://des.nh.gov/organization/divisions/ water/dwgb/dwspp/dwsap.htm.

How can I get involved?

The Mountain Lakes District Water Committee meets monthly at the District office (Please call for times and schedule).

For more information about your drinking water please contact the Mountain Lakes District

Mountain Lakes District 75 White Mountain Drive Woodsville NH, 03785 Office: (603) 787 6180 Fax: (603) 787 2154

E-mail: District@mtnlakesnh.com

mtnlakeswater@yahoo.com

Web: <u>WWW.mountainlakesnh.com</u>

District Commissioners:

Chris Demers / Robert Long / Beverly Jacobs,District Office Administrator:Marsha Luce,Water System Operator:Donald Drew

Violations and Other information: We are pleased to report that all of our water sources are safe to drink. We have met state and Federal requirements and had no violations on our Sanitary Survey. Refer to the tables for some notable detections in the water. We did not exceed any of the MCL's. In May 2011 we had a bacteria hit during our routine monthly test. After a mandated series of tests (ten total) we found no bacteria problem in the system. All test are available at the Mountain Lakes District office.

Definitions

Ambient Groundwater Quality Standard or **AGQS**: The maximum concentration levels for contaminants in groundwater that are established under RSA 485-C. the Groundwater Protection Act.

Action Level or **AL**: The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level or **MCL**: The highest level of a contaminant that is allowed in drinking

water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal or **MCLG**: The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level or **MRDL**: The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Maximum Residual Disinfectant Level Goal or MRDLG: The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Treatment Technique or **TT:** A required process intended to reduce the level of a contaminant in drinking water.

Turbidity: A measure of the cloudiness of the water. It is monitored by surface water systems because it is a good indicator of water quality and thus helps measure the effectiveness of the treatment process. High turbidity can hinder the effectiveness of disinfectants.

Abbreviations

BDL: Below Detection Limit mg/L: milligrams per Liter NA: Not Applicable ND: Not Detectable at testing limits NTU: Nephelometric Turbidity Unit pCi/L: picoCurie per Liter ppb: parts per billion ppm: parts per million RAA: Running Annual Average TTHM: Total Trihalomethanes UCMR: Unregulated Contaminant Monitoring Rule ug/L: micrograms per Liter THE FOLLOWING APPLIES if these contaminants are present - see table for detected levels.

THE FOLLOWING APPLIES if these contaminants are present - see table for detected levels.

Drinking Water Contaminants:

Lead: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. This water system is responsible for high quality drinking water, but can not control the variety of materials used in your plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing cold water from your tap for at least 30 seconds before using water for drinking or cooking. Do not use hot water for drinking and cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at

http://water.epa.gov/drink/info/lead/inde x.cfm

Radon: Radon is a radioactive gas that you can't see, taste or smell. It can move up through the ground and into a home through cracks and holes in the foundation. Radon can also get into indoor air when released from tap water from showing, washing dishes, and other household activities. It is a known human carcinogen. Breathing radon can lead to lung cancer. Drinking water containing radon may cause an increased risk of stomach cancer.
